TASK – 1

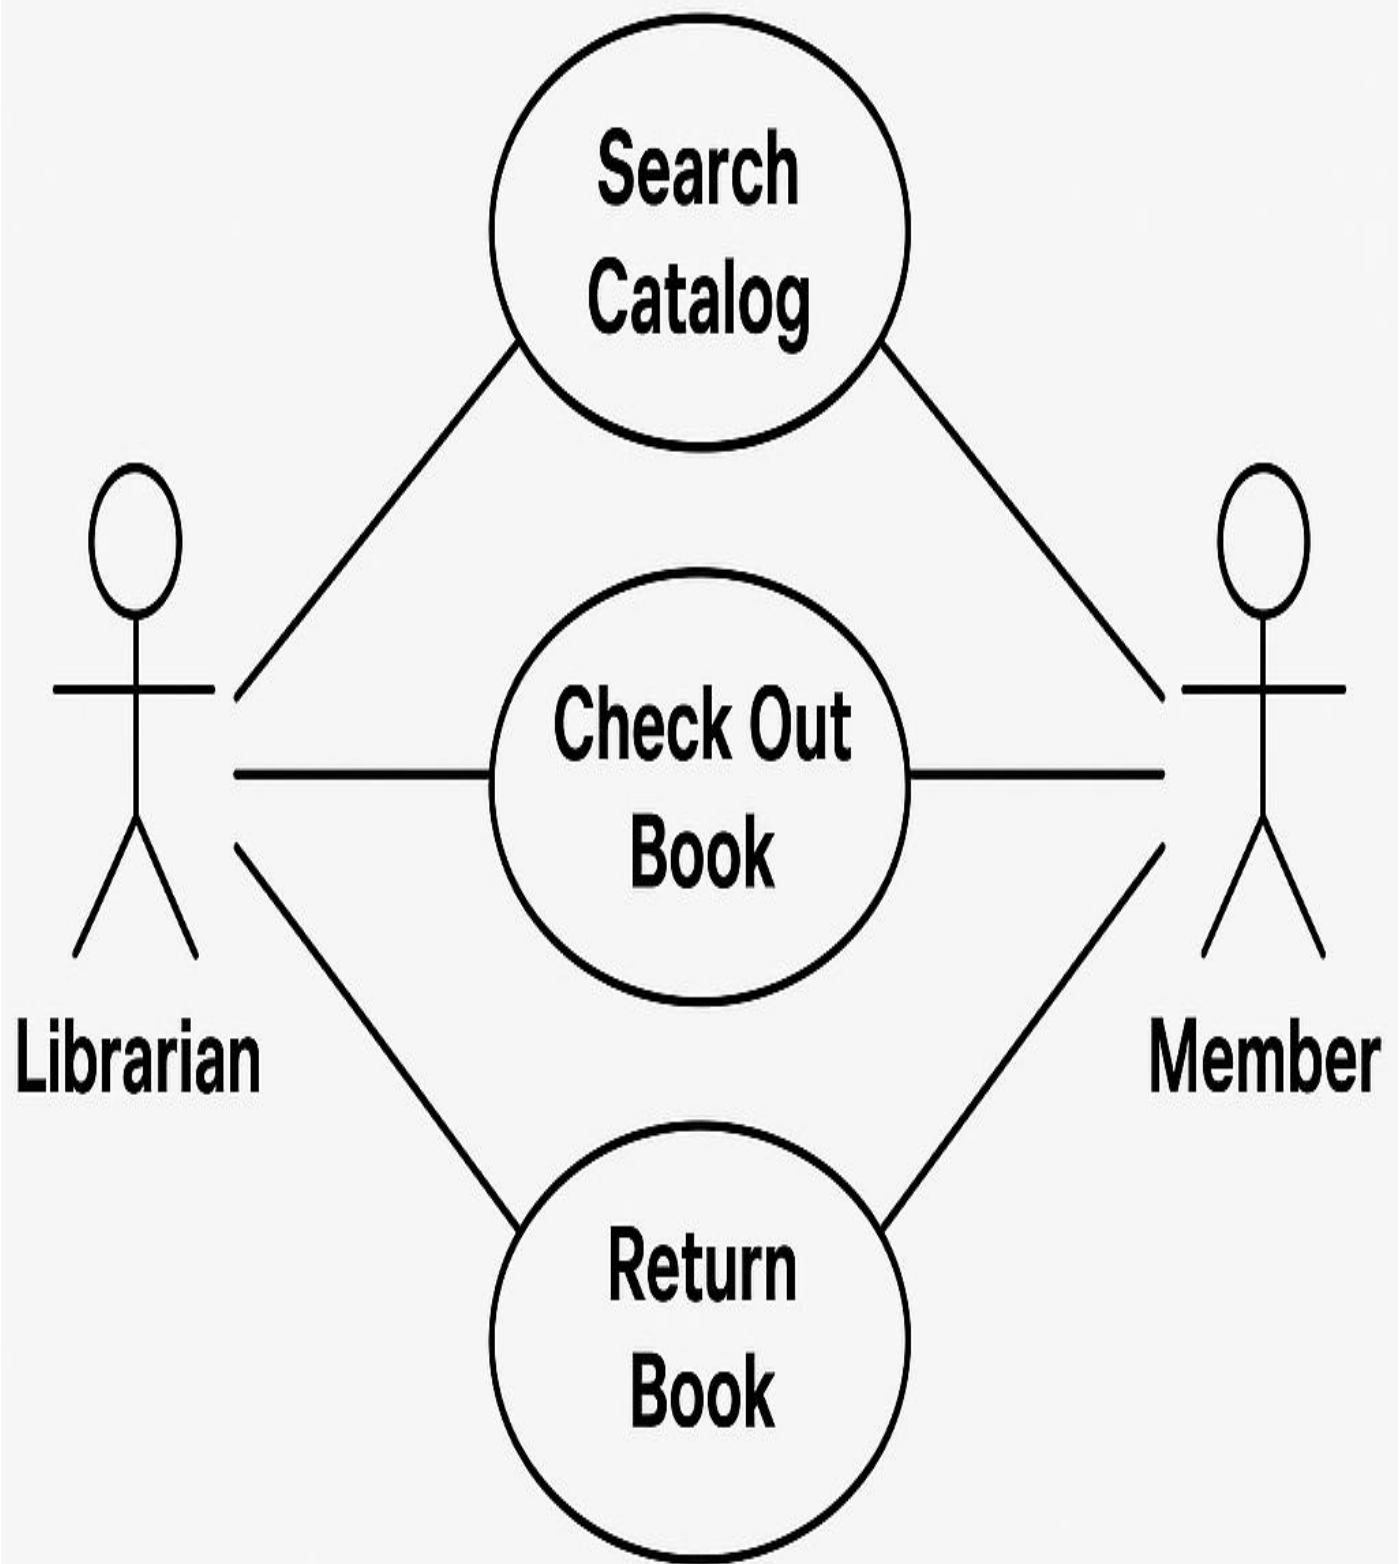

Task 1: Use-Case Diagram Creation

Objective: Create a simple use-case diagram for a Library Management System.

Steps to Perform:

Identify at least two actors who will interact with the system (e.g., Librarian, Member).

Determine

1 A use-case diagram visually represents the functional requirements of a system and the interactions between the system and external users (actors). It helps in identifying the scope of the system, user roles, and system functionalities.

1 Actors: Entities (user or other systems) that interact with the systems.

- Librarian - Manages library transactions.
- Members - Uses library services such as searching, borrowing, and returning books.

2 Use Cases: Functionalities or service provided by the system.

- Search Catalog: Allows members and librarians to browse the book database.
- Check out Book: Enables users to borrow a book from library.
- Returns Book: Lets user return borrowed books.

3 System Boundary (not shown in basic diagram): Typically represented by a box around use cases to indicate what is part of the system.

Purpose of This Diagram:

- To understand user interactions with the systems.
- To aid system ~~analysts~~ analysts and developers in building system functionality.
- To form the basis for writing detailed requirements and test cases.
